Testing in SDLC should follow a structured process in every development phase.

→ Requirement analysis: Identify testing needs from requirements

→ test planning: Define testing scope, resource tools

→ test case design: Prepare test cases with excepted input and output

→ unit testing: testing individual modules

→ integration testing: Verify that connected modules work correctly

→ Regression testing: verifying whether newly added features are distrubing old features.

→ system testing: test complete application functionality

→ Acceptance testing: Verify that application meets customer requirements.

4. Classification of Error, defect & failure

Error:- A human mistake made by developer

Example:- writing incorrect password validation

defect:- A flaw in the software caused by error

Example:- login code accepts incorrect password.

failure:- The software behaves incorrectly when executed

Example:- User successfully logsin with a valid credentials

13 defects dueto to unclear requirements

Historical defects data helps testers identify modules that previously contained defects. They can reuse related test cases during regression testing after software changes.

This improves test coverage, save time, and helps prevent old defects from reappearing

15 Defect Prevention

defect Prevention involves identifying and eliminating the root cause of recurring defects.

Techniques include requirement reviews, code reviews, code reviews, developer training, root cause analysis.

These practices reduce repeated defects improve long-term software quality.

17 Testing vs debugging

Testing identifies defects by executing examining software, while debugging finds the cause of a defect and fixes it

Example) testing reveals ATM deducts money incorrectly and debugging helps developers locate and correct faulty logic

Cross Browser testing

Cross-browser testing verifies that a web application works consistently across browsers such as Chrome, firefox and Edge

Tester should check functionality, layout, forms compatibility

19. Testing validation in a logistic application

The logisites application produces inconsistent outputs due to improper input validation.

Tester should verify, valid, invalid, missing & incorrect input values.

20. importantance of systematic test case design.

Random testing may miss important defects because it does not cover all requirements.

Tester should prepare test cases with inputs, expected results, actual results.

22. Roles of tester across SDLC phases

testers should participate in requirement analysis, test planning, test design, execution maintenance.

25. improving testing in a banking systems:

Repeated transaction failures indicate inadequate testing of banking functions.

- Tester should perform
  - → unit testing
  - → regression testing on deposits & withdrawl
  - → fund transfer.
